

This adpter board provides a control and power down interface to the Analog Devices EVAL-CN0357 electrochemical sensor front end.

The TPS22919 power switch provides for low power shutdown.

The footprints for the Electrochemical Cells are included for testing fit before next prototype. They can be wired down to the CN0357 board underneath or this section can be cut away.

A future version of this board could directly incorporate the ADC / voltage ref / TIA amp etc. to reduce costs.
